"Calculation of Hollow Shells of Nonlinearly Elastic Materials Under Small Deflections"

Sb. tr. Mosk. inzh.-stroit. in-t (Collection of Works of Moscow Structural Engineering Institute), 1970, No. 84, pp 11-17 (from RZh-Mekhanika, No 9, Sep 71, Abstract No 9V450)

Translation: Assuming that the material of the shell conforms to the equations of the theory of small elastic-plastic deformations under the polynomial simplification

$$\delta_i = A\epsilon_i + B\epsilon_i^2 + C\epsilon_i^3 + \dots$$

and using statistical and kinematic hypotheses of the geometrically linear theory of thin hollow shells, the authors compile an expression for the frictional of the total energy of the shell. On this basis and using the Ritz method for two variable parameters, the authors make an approximate examination of the deformation of a hollow spherical shell loaded by pressure that is square in plan and supported along a contour. V. I. Rozenblyum.

"Effectiveness of Furazolidone and Bacteriophage in the Treatment of Staphylococcal Diseases"

Kiev, Vrachebnoye Delo, No 3, 1972, pp 144-147

Abstract: Furazolidone along or in combination with antibiotics was effective in 62% of patients (52 were treated) against sepsis, pneumonia, enterocolitis, cholecystitis, and other diseases caused by *Staphylococcus*. The therapeutic effectiveness of polybacteriophage prepared from many strains of bacteria was studied on 278 patients afflicted with various diseases with staphylococcal complications. The bacteriophage was effective in 87% of cases in doses not exceeding 20-40 ml. There were no side effects from the bacteriophage, with the exception of a slight rise in temperature in some patients, which is attributed to the intoxication caused by lysis of *Staphylococci* under the effect of bacteriophage. In many instances the bacteriophage was effective where other preparations failed. One of its advantages is its ability to be combined with antibiotics and it always prevents the development of dis-bacteriolysis. Details of methods of applying the bacteriophage are given.

APPLICATION OF STAPHYLOCOCCUS BACTERIOPHAGE
FOR THERAPEUTIC AND PROPHYLACTIC PURPOSE

V. A. Proskurov

Staphylococcus bacteriophage was used in 148 patients with various localization of staphylococcus infection (cholecystitis, enterocolitis, peritonitis, endometritis, sepsis, pleurisy, sinusitis, otitis, conjunctivitis, osteomyelitis, complicated wounds and thermic burns). A favourable therapeutic effect was obtained in 120 of 148 patients (81%).

Patients unsuccessfully treated with antibiotics and hormonal preparations for chronic staphylococcus affections (cholecystitis, sinusitis, peritonitis, etc.) completely recovered or improved considerably after bacteriophage therapy.

Bacteriophage treatment of carriers among the personnel of maternity hospitals proved to be effective in $46 \pm 9\%$ ($p \pm m$) of the cases. Probability of differences with control group was authentic ($p < 0.05$).

The use of bacteriophage for therapeutic and prophylactic purpose was not accompanied by unfavourable side-effects.

ROLE OF STAPHYLOCOCCI IN THE DEVELOPMENT
AND COURSE OF ERYSIPelas

V. A. Proskurov (Odessa)

Analysing 61 patients suffering of erysipelas with staphylococcal complications the author stresses general increase of diseases caused by antibioticoresistant staphylococcal strains.

The etiological role of the staphylococcus in the development of erysipelas was verified bacteriologically and allergologically.

A favourable result was received with inclusion in the treatment of native staphylococcal anatoxine. The use of anatoxine did not cause any unfavourable side-effects.

The use of anatoxine is recommended in all patients with erysipelas for the prophylaxis of staphylococcal complications.

"The Determination of Optical Constants of Semiconductor Glasses in the Spectral Region 1.1 to 1.6 mm"

Leningrad, Optiko-Mekhanicheskaya Promyshlennost', No 2, Feb 73, pp 62-63

Abstract: A method for experimentally determining the optical constants of semiconductor glasses in the submillimeter region of the spectrum, using a prism at minimum deflection for determining the refraction coefficient, a plane-parallel plate for the absorption coefficient, a goniophotometer, an optical acoustic detector and a reverse wave lamp is presented. The results obtained make it possible to calculate the absorption coefficient and the refraction. As an example of the use of this method the results of the measurement of a sample of chalcogenite glass are presented.

"Study of the Conversions of Dialkylphosphites in Synergistic Mixtures with MB-1 in the Process of Inhibited Oxidation of Decane"

Leningrad, Zhurnal Prikladnoy Khimii, Vol 46, No 6, Jun 73, pp 1329-1333

Abstract: An attempt has been made to investigate the chemical conversions of diisopropylphosphite [DIP] and diisooctylphosphite [DOP] in the process of inhibited oxidation of decane at 175° by means of IR and PMR spectroscopy. On the basis of spectral data it has been shown that the hydrocarbon portion of DIP and DOP are eliminated in pure state and in the hydrocarbon medium (175°) with the formation of phosphorus acid. An effect of synergism has been established for the composition of phosphorus acid with 4,4'-Methyl-bis-2,6-di-tert-butylphenol [MB-1] during the process of inhibited oxidation of white oil, the reaction being carried out at 175°, with total concentration of 0.005 g-mole/l.

"Synergism of Mixtures of Alkylphenol and Phosphonate Anti-
oxidants in the Process of Oxidation of White Paraffin Oil"

Leningrad, Zhurnal prikladnoy khimii, Vol 64, No 10, Oct 71,
pp 2349-2352

Abstract: This paper deals with new antioxidants, their mixtures and synergistic properties. Alkylphenols are the basic anti-oxidants; thiocarbonates, sulfides, phosphites and phosphonates are the synergists which enhance the inhibiting action of alkylphenols. An attempt to explain the mechanism and factors responsible for the synergistic effect is described here. The experiment involved dialkylphosphonate (as the synergist) and alkylphenol (antioxidant). Mixtures of both were tested on white paraffin oil as a readily oxidizable medium. The total concentration of the inhibitors in the oil was constant and equal to 0.005 mol/l. Only the "phosphite-phenol" ratio was varied. Binary diagrams were plotted on the basis of the test data for
1/2

USSR

NOVOSELOVA, L. V., et al, Zhurnal prikladnoy khimii, Vol 64,

each individual component and of the phosphite-phenol mixtures as functions of concentration. The results show ionol:MB-1 in ratios of 0.001:0.004 and 0.002:0.003 to have the highest synergistic effect. The maximum induction period exceeded that of the most effective inhibitor, at a concentration of the latter equal to the total, by a factor of 2.0-2.5. When used independently, the antioxidants were not very effective. In mixtures with thiophosphonate they inhibit oxygen absorption, with the effect directly proportional to the content of thiophosphonate. Curves are shown to demonstrate the kinetics of oxygen absorption during oxidation of paraffin oil in the presence of different mixtures of inhibitors at 175°C; the induction period of paraffin oil oxidation as a function of phosphonate: ionol molar ratio.

Moscow, Tekhnologiya Uprochnyayushche-Kalibruyushchey i Formoobrazuyushchey Obrabotki Metallov (Technology of Calibration-Hardening and Form-Shaping Treatment of Metals), Izd-vo "Mashinostroyeniye," 1971, 208 pp

Translation of Foreword: It has been established from numerous investigations that the surface condition of machine parts determines to a considerable extent the wearing qualities, strength, corrosion resistance, and other operational properties of machines. Of the technological methods for improving the surface condition, the methods of final cold treatment of parts with calibration-hardening instruments are the most progressive. Nowadays, the following methods of mechanical surface hardening of metals are widely used: rolling and unrolling with rolls or balls, rolling between rolls, expanding by mandrel of cylindrical and section-shaped openings, centrifugal ball working, processing with mechanical brushes, and the like. Also widely used are form-shaping processes of cold treatment of complex surfaces with simultaneous surface layer hardening of the metal, in particular: thread

PROSKURYAKOV, YU. G., Tekhnologiya Uprochnyyayushchee-Kalibruyushchey i Formoobrazuyushchey Obrabotki Metallov, Izd-vo "Mashinostroyeniye," 1971, 208 pp

rolling, final drawing of shaped profiles, rolling low-module teeth of gear wheels, slots, ripples and signs, rotation cogging, and the like. These processes, which also are based on the principle of interaction and surface rolling with a precision form-shaping instrument, guarantee a high precision of calibration and final treatment of parts. A classification is given of the principal methods of calibration-hardening and form-shaping treatments of metals on the basis of an analysis of stress-strain conditions of the metal in the contact zone with the working instrument. Principal technological systems of calibration-hardening and form-shaping treatment of metal are discussed. Constructions and calculations of typical instruments, appliances, and technological equipment are presented and the effect of the quality of hardened surfaces on operational characteristics of machine parts is demonstrated. On the basis of generalized scientific and operational results and information in the literature, all necessary data are given for the calculation and

selection of processing conditions of parts by the described methods. The high temperature which is generated in calibration-hardening treatment in surface layers of instruments and billets can result in thermal decomposition of the lubricant, breakdown of lubrication properties, and changes in the microstructure of the metal surface layer. Therefore, the temperature gradients on the contact surface and in the depth of the processed metal are analyzed for different processes of hardening, the effect of temperature on metal gripping, and spew development on the instrument. The wear of the instrument, affected by temperature and friction, is demonstrated and recommendations are made for the prevention of these occurrence.

"Condensation of 1,2,5-trimethylpiperidone-4 With Ethyl- and Naphtyl-acetylenes and Synthesis of Substituted Pyridines"

Riga, Khimiya Geterotsiklicheskikh Soyedinenii, No 3, Mar 73, pp 349-352

Abstract: 1,2,5-Trimethylpiperidone-4 condensed under conditions of Favorskii reaction with 1-butyne, α - and β -naphtylacetylene yields 4-(1-butynyl)- and 4-naphtylethynyl-1,2,5-trimethylpiperidols-4, which after hydrogenation over Raney nickel gave 4-n-butyl-, 4-(2 α -naphtylethyl)- and 4-(2 β -naphtylethyl)-piperidols-4. These piperidols can be converted to pyridine bases by dehydration, catalytic dehydrogenation and N-demethylation. In this fashion 2,5-dimethyl-4-phenylpyridine was obtained from 1,2,5-trimethyl-4-phenyl-piperidience. Condensation of 2,5-dimethyl-4-phenylpyridine with formaldehyde yields 5-methyl-2-(β -hydroxyethyl)-4-phenylpyridine and 2-(5-methyl-4-phenylpyridyl-2)-propanediol-1,3. The first product was converted to the urethane N-phenyl- β -(5-methyl-4-phenylpyridyl-2)ethylcarbamate and dehydrated to 5-methyl-2-vinyl-4-phenylpyridine. 2,5-Dimethyl-4-n-butylpyridine

"Substituted Pyridines. 5-Methyl-4-phenyl-2(aminoalkoxy, aroxymethyl)pyridines"

Riga, Khimiya Geterotsiklicheskikh Soyedineniy, No 9, Sep 71,
pp 1211-1212

Abstract: 2,5-Dimethyl-4-phenylpyridine was used in the synthesis of α -aminomethyl and α -alkoxy(aroxy)methyl derivatives of this pyridine system. The transition from the pyridine base to its derivatives was accomplished through 5-methyl-4-phenyl-2-(bromo-methyl)pyridine. Bromination of 2,5-dimethyl-4-phenylpyridine was accomplished with N-bromosuccinimide by the Wohl-Ziegler reaction in the presence of benzoyl peroxide.

"2- ω -Hydroxyalkyl-3-Methylindano[2,1-c]Piperidine"

Riga, Khimiya Geterotsiklicheskikh Soyedineniy, No 5, 1972, pp 666-668

Abstract: In order to obtain physiologically active preparations of partially hydrogenated azafluorenes for systematic stereochemical studies, investigations were commenced on sodium reduction of 3-methyl-2-azafluorene (I) in an alcoholic solution. Of the four possible isomers of 3-methylindano[2,1-c]piperidine (II) that could have been expected, only two were actually formed: one isomer was a liquid (IIa) with a b.p. of 115°C, and the other a crystalline substance (IIb) with a m.p. of 81.5-83°C. IR spectra confirmed the structure of II and indicated hydrogen bonding between the molecules involving the -NH group. This mixture of the II isomers was employed for the synthesis of 2- ω -hydroxyalkyl-3-methylindano[2,1-c]piperidines which are of pharmacological interest. Ethylene and butylene chlorohydrins were used for the alkylation of II in the presence of KI and K_2CO_3 , and chromatographic analysis of the products (III) and 2- δ -hydroxybutyl-3-methylindano[2,1-c]piperidine, respectively.

PROSTAKOV, N. S., et al., Khimiya Geterotsiklicheskikh Soyedineniy, No 5, 1972, pp 666-668

Each of the latter two compounds existed in the form of two isomers which apparently corresponded to the two isomers of II. The IR spectra of III showed a wide absorption band at 3420 cm^{-1} which represents the involvement of the -OH group in intermolecular hydrogen bonds, and an intense absorption at 1600 cm^{-1} corresponding to the C-O bond of the primary alcohol. Subsequent communication shall deal with the stereochemistry of the geometric isomers of III.

raised to a given height, that is, higher or lower than the given level of the headrace so that the dam can operate as a spillway passing the given amount of water. In order to lower the level of the headrace by a given amount, the excess air is released from the shell by the attachment 7. To prevent freezing the dam is equipped with the tubes 4 and 5 laid along the bottom on both sides of the dam. Compressed air bubbles are released through the holes in the tubes. As these bubbles rise, they expand and carry along large masses of bottom water with a positive temperature to the surface. This causes intense vertical circulation of the water in the river and prevents the formation of ice along the pressure front of the dam. There is 1 illustration.

"Purification of Cultural Foot-and-Mouth Disease Virus"

Moscow, Veterinariya, No 1, Jan 71, pp 41-42

Abstract: The starting material was A₂₂ virus replicated in a monolayer of primary trypsinized pig epithelial and calf kidney cells. The virus-containing material was subjected to a series of procedures beginning with freezing, thawing, and centrifugation and ending with filtration through Sephadex G-100 or G-200, both in order to obtain different fractions and to remove proteins and nucleic acids. Some 99.3% of the ballast proteins and 99.2% of the tissue nucleic acids were thus removed. Despite the many manipulations of the virus, its infectious titer at the end was higher than in the original suspension. The purified preparation can be lyophilized for the accumulation of virus material or for deproteinization in order to obtain infectious RNA with a molecular weight no lower than 100,000.

"The Problem of the Use of Coagulators During Deoxidation of Steel by Aluminum"
Moscow, Izv. Vuzov, Chernaya Metallurgiya, No 2, 1971, p 51-55.

Abstract: Analysis of the hydrodynamic and thermodynamic factors shows the possibility of using secondary large particles as coagulators for the products of deoxidization of steel with aluminum. The introduction of crushed lime, feldspar, and aluminum to the center mass during deoxidization in the process of siphon pouring of seven-ton ingots of type 3 kp steel was tested. Studies of rolled products produced from these ingots confirmed experimentally the possibility of reducing the level of contamination of the steel with stable nonmetallic inclusions by combined introduction of deoxidizers and coagulators.

"Plasma-Arc Cutting in Sea Water"

Moscow, Svarochnoye Proizvodstvo, No 6, Jun 73, pp 52-53

Abstract: The authors determine the requirements for a plasma cutting torch which can work in sea water. A cutting torch is tested which can ensure the reliable parting of hull grades of steel up to 40mm thick in sea water with a salinity of 20 percent at a depth of 10m. The cutting is done at a current of 500-520amp and an arc voltage of 120-140v. The cutting rate of the plasma-arc is 2-5 times greater and the productivity is 3-8.5 times greater than is the case with electro-oxygen cutting.

"Method of Successive Approximations for Numerical Solution of Fredholm's Integral Equations of Second Kind"

Kiev, Dopovidi Akademii Nauk Ukrains'koi RSR -- Seriya A. Fizyko-Tekhnichni ta Matematychni Nauky, No 4, Apr 73, pp 353-357

Abstract: A previous article by L. M. LYTVYNNENKO described a method for the solution of an infinite system of algebraic equations of the second kind, in which preliminary inversion of part of the operator is used to construct a convergent iterative process. In the present article a similar method of successive approximations proves effective for the numerical solution of Fredholm's integral equations of the second kind, especially with an infinite interval of integration. The method is substantiated and tested for the integral equation in the problem of electromagnetic wave diffraction by a slit in a metal screen. The method makes it possible to obtain a numerical evaluation of the error of solution and a substantial decrease in the interval of integration by replacing the original integral equation at each approximation stage with an equation with some new free term, whose value at each point of the domain of definition of the sought function can be found by numerical

integration. The possibility of narrowing the interval of integration is especially important in the case of infinite intervals, making it possible to use the degenerate kernel method to construct the resolvent of the integral equation and evaluate the error of solution of the integral equation at each approximation stage. If the integral equation is replaced by a finite system of linear algebraic equations for computer-aided realization of the method, the order of this system can be considerably lowered by reducing the interval of integration and performing only one inversion of the matrix, since the same inverted matrix is used in all subsequent iterations.

"Theory of the Fabry-Pérot Interferometer With Mirrors in the Form of Flat Grids for an Inclined Incident Wave"

Leningrad, Optika i Spektroskopiya, vol 32, No 3, 1972, pp 592-600

Abstract: This article considers the characteristics of the Fabry-Pérot interferometer with mirrors made up of plane ribbon grids, where the incident wave is inclined and is a planar electromagnetic wave of two polarizations, with the E and H vectors parallel to the grid ribbons. The considerations of the authors are based on a rigorous solution of the diffraction problem, which makes possible the determination of the utilization area and the estimation of the error of the approximation formulas. Analysis of the problem -- made for the single-wave case, when the higher diffraction harmonics of the fields at the ribbons drop off exponentially with the distance from the mirror plane -- permitted discovery of very narrow-wave passage interference maxima with changes in the incidence angle. This important characteristic can be successfully used in metrological practice. An explicit dependence of the resolving power on structural parameters is found which permits construction of the interferometer with two grids having the characteristics necessary for this application.

Moscow, Zhurnal Nevropatologii i Psichiatrii imeni S. S. Korsakova, Vol 71, No 7, 1971, pp 1,001-1,006

Abstract: A comparative study was conducted of 61 cases of tickborne encephalitis in Belorussia in 1966-1968 and of 149 cases of tickborne encephalitis in Khabarovskiy Kray during the same period. While the disease in Khabarovskiy Kray was accompanied by bulbar and residual paralyses in a large number of cases (24.2%) and had a relatively high mortality (16.8%), in Belorussia it was predominantly of the meningeal or general infection type and had a favorable outcome (95.2% of the patients recovered completely and there was not a single death). Residual paralyses and pareses were observed in 14.8% of cases in Khabarovsk Kray, whereas full motor capacity of paretic extremities was usually restored in Belorussia. Fever was the principal component of the clinical syndrome in Belorussia in the acute period; the symptoms of a meningeal

XV-8. PREPARATION OF THE FILM STRUCTURE OF CERTAIN SEMICONDUCTORS IN THE CASE OF LASER DEPOSITION OF SPECIMENS

Article by Yu. G. Polovtsev, V. P. Zakharov, I. M. Protas, N. V. Shchegoleva
 III Symposium No. 10 "Problems of Structure, Polymorphism, Kinetics,"
 Dnepropetrovsk, Ukraine, May 17 June 1972, p. 227

The thermal deposition of chemical compounds containing components with high vapor pressures frequently cannot be used to obtain concentrated films of polychromic composition. Definite progress has been made in this direction in the presence of laser deposition of the samples. An estimate was made of the role of the molecular composition of the vapor and the interatomic interactions with this type of deposition for the process of formation of amorphous film structures on a glass substrate. The research subjects were semiconductors of the Al₂O₃ and Al₂O₃-V₂O₅ type. The molecular composition of the vapor was investigated mass-spectrometrically; the structure of the amorphous film was investigated by the method of integral analysis of the electron scattering intensity curves.

It is established that the gas-vapor contains ionized and neutral, complex coordinated atoms of the same and different types, and the structure of the amorphous film is well described by the model of dispersed crystals. In contrast to this, in GaP vapor, clusters of atoms of different types are commonly absent, and in the amorphous film structure, in addition to the "crystall-like" regions, there are regions containing atoms of one type with the structure of amorphous phosphorous and gallium.

For Al₂O₃, Al₂O₃ and Al₂O₃, the molecular composition of the vapor turned out to be similar, whereas the structure of the amorphous film was different. Thus, for example, in the Al₂O₃ film the value of the radius of the first coordination sphere and the coordination numbers are the same as in the crystal, and in the Al₂O₃ film they are appreciably less.

The results obtained have permitted evaluation of the effect of the molecular vapor composition on the processes of the formation of the film. A description is given for the structures of the investigated substances. A description is given for the probable kinetics for the formation of the film structure.

"Mass-Spectrometric Study of the Evaporation of Type A^{III}B^V Semiconductor Compounds by Laser Emission"

Leningrad, Zhurnal Tekhnicheskoy Fiziki, Vol XLII, No 3, 1972, pp 670-672

Abstract: Mass-spectrometric studies of vapor composition were performed during evaporation of single GaAs and GaP crystals by ruby laser emission. The qualitative composition of the vapor in both cases was similar (the Ga⁺, As⁺ and As₂⁺ ions for GaAs predominate, and the Ga⁺, P⁺, P₂⁺ for GaP); however, the relative intensity distribution between them is not retained. The predominant composition of the part of the vapor not ionized by the laser emission was established by using additional ionization of the vapor by a high frequency spark. The causes of the quantitative differences in the vapor during evaporation of single GaAs and GaP crystals by ruby laser emission were discussed. The results were compared with analogous results for thermal evaporation. In the case of additional ionization of the plasma, the A: As and Ga: P ratios found from the mass spectra approach stoichiometric. Thus, the degree of ionization of Ga during evaporation by laser emission is appreciably higher than for thermal evaporation, and the part of the vapor ionized by the light

"Block of Neuromuscular Conduction by Choline Esters in the Presence of Cholinesterase Inhibitors and Restoration of Conduction Through Reactivation of Cholinesterases"

Moscow, Doklady Akademii Nauk SSSR, Vol 209, No 5, 1973, pp 1243-1246

Abstract: The amount of suberyldicholine (a dicholine ester of dicarboxylic acid) necessary to produce the desired degree of neuromuscular block is considerably reduced after inhibition of cholinesterase. Quaternary ammonia compounds such as GT-165 and AA-31 are safe cholinesterase inhibitors because they penetrate the blood-brain barrier to a very small extent. In cats, inhibitor GT-165 (0.1 micromol/kg) reduces the blocking dose of suberyldicholine by a factor of 100, while inhibitor AA-31 (10 micromol/kg) reduces this dose by a factor of 25-30. In both cases, administration of cholinesterase reactivator TMB-4 (dipiroxime) in a dose of 4 mg/kg rapidly eliminates the conduction block. In rat nerve-muscle preparations, a $\times 10^{-5}M$ conc. of suberyldicholine in the bathing liquid reduces transmission by 50%. In the presence of $10^{-6}M$ GT-165, the suberyldicholine concentration necessary to produce the same effect

1/2

USSR

PROTAS, L. L., Doklady Akademii Nauk SSSR, Vol 209, No 5, 1973, pp 1243-1246
is reduced by a factor of 100-200, while 10^{-6} M AA-31 reduces this dose by a factor of 25-30. Addition of dipiroxime (10^{-5} M) almost immediately restores full conduction. In these concentrations, GT-165 and AA-31 inhibit not only cholinesterase but also acetylcholinesterase. The method offers good control over the depth and duration of neuromuscular block.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE DISLOCATION STRUCTURE AND MECH. TWINNING IN QUENCHED AND AGED CU PLUS 4.3PERCENT TI AND CU PLUS 2.3PERCENT TI PLUS 2PERCENT AL ALLOYS WERE STUDIED BY THIN FILM ELECTRON MICROSCOPY. THE CHARACTERISTIC FEATURE OF THE DISLOCATION STRUCTURE OF QUENCHED ALLOYS IS THE PRESENCE OF FLAT DISLOCATION CLUSTERS. THESE SHOWED UP TO A LESSER DEGREE IN THE TERNARY ALLOYS THAN IN THE CU-TI ALLOYS. THE BROAD TWIN INTERLAYERS AS OBSO. THROUGH METALLOGRAPHY ARE INDEED MICROTWIN BUNDLES WHICH HAVE A RATHER PERFECT STRUCTURE. MECH. TWINNING WAS OBSO. BOTH AT THE STAGE CORRESPONDING TO THE APPEARANCE OF THE SATELLITES ON X RAY DIFFRACTION PATTERNS AND ON THE STAGE OF THE DEVELOPMENT OF THE METASTABLE BETA PRIME PHASE. THE RESULTS OBTAINED DO NOT ALLOW THE CONCLUSION TO BE MADE THAT THE PPTS. ARE NOT BEING SLIT THROUGH BY THE DISLOCATIONS; THIS FACT IS CONFIRMED ALSO BY THE FACT THAT MECH. TWINS ALSO PASS THROUGH THE PPTS. THE PPTN. OF THE METASTABLE PHASE FIRST LEADS TO SLIP HOMOGENIZATION, AND SECONDLY, DETS. THE APPEARANCE OF A NEW DEFORMATION MECHANISM, NAMELY MECH. TWINNING. IN THE CU PLUS 2.3PERCENT TI PLUS 5PERCENT AL ALLOY, NUCLEATION OF THE STABLE PHASE ON THE DISLOCATIONS WAS OBSO. THE PRESENCE OF THE LATTER LEADS TO THE FORMATION OF A DISLOCATION STRUCTURE CHARACTERIZED BY UNIFORM DISTRIBUTION OF THE DISLOCATIONS THROUGH THE BULK OF THE MATERIAL. THE OBSO. CHANGES DUE TO THE AGING PROCESS ARE ASSOC'D. NOT ONLY WITH THE CHANGE IN THE LOCALIZATION AND MULTIPLICITY OF SLIP BUT ALSO WITH A CHANGE IN THE FREE PATH OF THE DISLOCATIONS.

"Reliability of Precision-Mechanical Instruments. Scientific Works of Saratov Polytechnic Institute"

Nadezhnost' priborov tochnoy mekhaniki. Nauch. tr. Saratov politekhn. in-t
(cf. English above), vyp. 55, Saratov, 1972, 114 pp, ill., 47 k. (from RZh-
Raketostroyeniya, otdel'nyy vypusk, No 12, Dec 72, Abstract No 12.41.181 K)

Translation: The results of studies performed at the branch and scientific research laboratory on the reliability of precision mechanical instruments under the department of gyroscopic instruments and devices of Saratov Polytechnic Institute are published in this collection. The articles in the collection are devoted to two aspects of the reliability problem: the technological guarantee of reliability of the structural elements and the development of highly reliable structural elements as applied to electromechanical devices and instruments. The results of studies of the processes of formation of the operational characteristics of the working surfaces operating with friction and sliding weakly-precision contacts are included. The results are published from analyzing the errors of gyroscopic devices during their operation under dynamic conditions and the analytical design of the gyroscopic devices.

"Excess Noise in Heterogeneous p-Al_xGa_{1-x}As--n-GaAs Photodiodes"

Leningrad, Fizika i tekhnika poluprovodnikov, No 10, 1972, pp 1851-
1855

Abstract: Stating that research on the noise characteristics of heterojunctions has been neglected, the authors present the results of experimental investigations into the low-frequency noise characteristics, at 20-2.10³ Hz, of p-Al_xGa_{1-x}As--n-GaAs specimens. The specimens were obtained by the growth of solid solution AlAs-GaAs p-type epitaxial layers on n-GaAs substrates. The current noise spectral density was measured in darkness with the heterojunctions biased in the forward as well as inverse directions, and with the heterojunctions illuminated in the gate and photodiode modes. The measurements were conducted at temperatures of 77-300° K and the wavelength of the illuminating light was 0.68 microns. It was found that the current noise was in all cases much higher than the shot noise level, and that illumination of the specimens did not vary the current noise spectral density with the specimens biased 1/2

"Determination of Informational Characteristics from the Condition of Minimum Risk in the Problem of Pattern Recognition".

V sb. Obnaruzh. i raspoznavaniye. Planir. eksperimentov (Detection and Recognition. Planning of Experiments--collection of works), Moscow, "Nauka", 1970, pp 3-10 (from RZh-Kibernetika, No 1, Jan 71, Abstract No 1V650)

Translation: The authors formulate the extremum problem of finding the vector function which recognizes membership to one of two patterns effectively and with minimum risk. In the final form, consideration is given to search for the informational characteristic u in the class of linear functions $u = \sum_{s=1}^n h_s r_s$ in the case of an ideal observer and a normal law of distribution of probabilities for patterns A_1 and A_2 . Then

$$h_1 = 1, h_s = \frac{\Delta_s \sigma_1^2}{\Delta_1 \sigma_s^2}, s = 2, 3, \dots, n, \Delta_s = a_{1s} - a_{2s}.$$

a_{is} , σ_s^2 are the averages and standard deviations of the normal laws of distribution. An example is given of calculations for comparison of methods

1/2

PROTASOV, K. T., SERYKH, A. P., Obnarush. i raspoznavaniye. Planir. eksperimentov, Moscow, "Nauka", 1970, pp 3-10

based on maximum information and on minimum risk as a function of the relative weight of errors of the first and second kind.

Note: The article does not give the explicit dependence of σ_i^2 on σ_{1i}^2 and σ_{2i}^2 .

"Study of the Intermolecular Dynamics of Condensed States of Matter by the Vibrational Spectroscopy Method. III. Experimental Investigation of the Temperature-Phase Relationship of the Intermolecular Dispersion Spectra of Some Organic Compounds"

Tomsk, Izvestiya: Fizika, No 5, 1970, pp 7-12

Abstract: Results of research on intensity distribution in the intermolecular dispersion spectrum are presented for a broad temperature range. The authors established the fact of continuous transition of the discrete spectrum (solid phase) into the continuous spectrum (liquid phase) as well as the presence of maxima in the intermolecular spectrum of some classes of fluids, the redistribution of intensities with temperature, and other rules governing the behavior which may, with sufficient basis, be considered general for substances with different types of intermolecular bond. Theoretical consideration with account taken of the degree of molecule-vibration noncoherence made it

1/2

possible to provide a qualitative, and, in a number of cases,
quantitative interpretation of these rules and to define a
series of molecular parameters for a whole group of substances.

"A Helical Electrode for Electrophysiological Studies of the Deep Structures
of the Brain"

Leningrad, Fiziologicheskiy Zhurnal SSSR imeni I. M. Sechenova, Vol 59, No 11,
Nov 73, pp 1764-1765

Abstract: Since helical electrodes have been successfully employed for long-term stimulation of smooth musculature, a similar electrode has been constructed for recording the biopotentials of the deep structures in the brain. The coiled electrode contains within it a guiding rod and the entire assembly is located within a hypodermic needle-like device for introducing the electrode. Once it is located in the desired region and the inner rod removed, the helical nature of the polyfluoroethylene-insulated electrode possesses sufficient elasticity to permit the outer tissues to heal around it and thus fix it. No additional outer fixation of the electrode is necessary.

"Sounds Emitted by the Anchovy (*Engraulis encrasicholus L.*) in a Light Field"

Moscow, Voprosy Ikhtioologii, Vol 12, Vyp 2(73), 1972, pp 394-396

Abstract: Apparently fish within a light field emit sounds that attract other fish outside the light field. This reaction was tested in 17 experiments with anchovies on the Black Sea in March 1970 using television, underwater photography, sound recording, and oscillographic analysis. Before light was introduced the fish emitted rare high-frequency crackling sounds and a low-frequency persistent drumming that was attributed to other fish species. When a submerged lamp was switched on the fish congregated about it, emitting sounds of higher frequency at a significantly greater rate. These results were confirmed with those of laboratory tank experiments with *Leucaspis delineatus* Heck. When lights were turned on after 3 minutes of darkness the acoustic activity of the fish increased noticeably. These significant differences in acoustic activity in the absence and presence of light should be studied in their application to fish attraction methods.

ALEKSEYEV, V. A., KOZLOV, N. P., and PROTASOV, Yu. S."Organic-Dye Laser"Moscow, Pribory i Tekhnika Eksperimenta, November-December 1973,
pp 137-138

Abstract: The description is given of a laser containing an alcohol solution of 6Zh rhodamine excited by the radiation of the plasma focus of a pulse accelerator operating in a plasma of metals and dielectrics. Light sources with pulse energies of up to 7500 J were used for pumping. Other details and technical characteristics of the laser are given together with a sketch showing some details of the instrument's structure. The reflector was made of polished duralumin in the form of an elliptical cylinder with a major semiaxis of 240 mm and a minor semiaxis of 210 mm. The energy generated was in the spectral range of 593-599 nm and the generation time was about 16 μ s.

"On Measurement of Small Deflections"

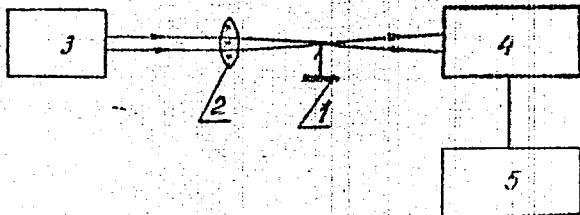

Moscow, Izv. VUZov: Mashinostroyeniye, No 9, 1972, pp 190-191

Abstract: The paper describes a procedure and experimental equipment for measuring displacements of the order of 10^{-3} mm at frequencies of the order of hundreds of kHz. The measurement installation is based on the Töpler schlieren method as illustrated in the diagram. Sharp-edged plate 1 is securely fastened to the article at the point to be measured in the plane of deflection. Lens 2 focuses a beam from gas laser 3 onto the sharp edge of this plate. The light beam is then allowed to fall on the cathode of photomultiplier 4 whose output signal is registered by oscilloscope or digital recorder 5.

"Study on the Superplasticity of TsAM 10-5 Alloy"

Moscow, Tsvetnyye metally, No 2, Feb 72, pp 58-60

Abstract: The study on the superplasticity of TsAM 10-5 alloy (5% Cu, 10% Al, up to 0.06% Mg, the balance--zinc) included the effect of the initial structure and the state of the treated alloy on its mechanical properties under static tensile tests within 200-350°C as well as changes in the alloy's microstructure during deformation under conditions of superplasticity. The alloy was tested as hot-extruded, hot-rolled, quenched and aged. In the process of superplastic flow the structure of the alloy appears to be almost identical in all cases and comprises a finely disperse mixture of phases with crystals measuring several microns. The TsAM 10-5 alloy exhibits its maximum tendency to superplasticity when its structure consists of finely disperse phases measuring several microns. An addition of magnesium increases the tensile strength of the alloy following its superplastic flow without affecting the superplasticity temperature interval. (2 illustrations, 1 table, 6 bibliographic references).

"A Method of Making Thiophosphonyl Dihalides"

USSR Author's Certificate No 337384, filed 31 Oct 69, published 2 Jun 72
(from RZh-Khimiya, No 9, May 73, abstract No 9N500 by T. G. Chekareva)

Translation: Compounds of the general formula RP(S)X₂ (I) (R = C₁-C₁₂-alkyl, cycloalkyl, aryl, unsubstituted alkyl or alkyl containing substituents, Cl or Br; X = Cl, Br) are synthesized by reacting (RS)₃P (II) with a 2-10-fold excess of PX₃ with heating to 250-330°C in an autoclave. Example. A mixture of 0.07 mole of II (R = Me) and 0.7 mole of PCl₃ is heated in an autoclave test tube of stainless steel at 290-320°C for 5 hours. The excess PCl₃ is driven off at atmospheric pressure and distillation of the residue in a vacuum gives I (R=Me, X=Cl), boiling point 70-3°/80, n₂₀D 1.5510, d₄²⁰ 1.4421, yield 52%. Similar methods are used to produce other compounds of type I (given are R, X, boiling point in °C/mm, n₂₀D, d₄²⁰, yield in %): Et, Cl, 64-8/15, 1.5418, 1.3527, 58; Pr, Cl, 85-8/15, 1.5285, 1.2942, 40; iso-Pr, Cl, 72-5/15, 1.5290, 1.3017, 47.5; Bu, Cl, 111-13/25, 1.5269, ..., 65;

"Synthesis of Thiophosphocyclopentenyl Chlorides"

USSR Author's Certificate No 327208, filed 16 Jun 70, published 28 Mar 72
(from Referativnyy Zhurnal -- Khimiya, Svodnyy Tom, (I, L-S), No 1(II),
1973, Abstract No 1N457P by T. A. Felyayeva)

Translation: The intermediate products for the synthesis of pesticides, the alkylthiophosphocyclopentenyl chlorides, were prepared during the reaction of diene hydrocarbon with alkyl dichlorophosphite and PCl_3 at 100-150°C. Example. One mole BuOH is added to 3 moles PCl_3 at 15-20°C with constant stirring, the mixture is heated at 60-65°C for 2-3 hr; the reaction mixture is cooled to 0-5°C, then 1 mole of cold $\text{CH}_2=\text{CHCH}=\text{CH}_2$ and 3 moles PCl_3 are added, the mixture is heated in a stainless autoclave at 110-120°C for 3 hr. The mixture is distilled and the mixture of acid chloride isomers of thiophosphocyclopentenic (2 and 3) acid is separated from the reaction mixture. The yield was 81%, b.p. 120-140°C/14, $n^{20}\text{D}$ 1,5840, d_4^{20} 1,3225. The acid chloride of 3-methylthiophosphocyclopentenic-3 acid was also obtained, b.p. 137-140°C/12, $n^{20}\text{D}$ 1,5895, m.p. 43-45°C, as well as mixture 1/2

"A Method of Producing Aryldibenzylphosphine Oxides"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztey, Towarnyye Znaki, No 3, 1970, p 32, patent No 259880, filed 14 Oct 68

Abstract: This Author's Certificate introduces: 1. A method of producing aryldi-benzylphosphine oxides of general formula

based on arylchlorophosphines, where X and Y are hydrogen, an alkyl, or a halide. The distinguishing feature of the method is that the process is simplified and readily available initial compounds are utilized by interacting aryl dichlorophosphine with benzyl chloride and elemental phosphorus

accompanied by heating. The reaction mixture is then boiled with an alkali and the product is isolated by conventional methods. 2. A modification of this method whose distinguishing feature is that the process is carried out at a temperature of 170-200°C.

"A Method of Making Dihalophosphines"

Moscow, Otkrytiya, izobreteniya, promyshlennyye obraztsy, tovarnyye znaki,
No 5, Feb 71, Author's Certificate No 292988, Division C, filed 10 Nov 69,
published 15 Jan 71, p 102

Translation: This Author's Certificate introduces: 1. A method of making dihalophosphines by interacting a hydrocarbon halide or polyhalide with white phosphorus or a phosphorus trihalide with the application of heat and in the presence of a catalyst, with subsequent isolation of the goal product by conventional methods. As a distinguishing feature of the patent, the yield of the goal product is increased by using selenium, selenium anhydride or phosphorus selenide as the catalyst. 2. A modification of this method distinguished by the fact that the process is done at a temperature of 250-380°C.

"A Method of Synthesizing 1,4-Phenylenehexabenzylidiphosphonium
Chlorides"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztsy, Tovarnyye
Znaki, No 14, 1970, Author's Certificate No 268418, filed 7 Jun
68, p 23

Abstract: This Author's Certificate introduces: 1. A method of
synthesizing 1,4-phenylenehexabenzylidiphosphonium chlorides. The
distinguishing feature of this procedure is that 1,4-phenylene-
bis-dichlorophosphine is interacted with substituted bensylchloride
and white phosphorus in the presence of heat with subsequent
isolation of the goal product by conventional methods. 2. The
method described in (1) is distinguished by the fact that the
temperature reaches 170-220°C.

"Method of Preparing Tin-Containing Dithiophosphonates"

USSR Authors' Certificate No 248673, filed 7 May 68, published
22 Jan 70, (from RZh-Khimiya, No 20 (II), 25 Oct 70, Abstract No
20 N554P by S. LYUBARSKAYA)

Translation: Compounds of the formula $\text{Zop9s09r0ssn}(\text{R}_2')\text{Z}_2\text{O}$ (I;
 R = alkyl, aryl, aralkyl; R' = alkyl; Z = substituted or unsub-
stituted aryl) are obtained by the interaction of the anhydride
of dithiophosphonic acid with bis-(arylhydroxydialkyltin)-oxide
at 50-100°. To a solution of 0.014 mole $(\text{MePS})_2\text{S}_2$ in 10 ml ClPh
is added 0.007 mole $\text{Z}_2\text{O}\text{Sn}(\text{Bu}_2)\text{Z}_2\text{O}$, and on conclusion
of the exothermic reaction it is heated for 2 hours in a boiling
water bath; the solvent is distilled off and bis-(2,4,5-trichloro-
phenoxymethyldithiophosphinyldibutyltin)- oxide, $n^{20}\text{D}$ 1.6005,
melting point 87-90°, is obtained. Analogously obtained are the
following I (R' = Bu; given are R , A, melting or softening point,
 $n^{20}\text{D}$): Me, alpha-naphthyl, 47-50, --; Ph, 2,4- $\text{Cl}_2\text{C}_6\text{H}_3$, 58-60, --;
 PhCH_2 , $p\text{-NO}_2\text{C}_6\text{H}_4$, 50-2, 1.635; PhCH_2 , Ph, 52-4, 1.6083; PhCH_2 , 2,4-
